chemesthesis are the chemically initiated sensations that occur via the touch system examples in the mouth include the burn of capsaicinoids in chilies the cooling of menthol in peppermint and the tingle of carbonation it is physiologically distinct from taste and smell but is increasingly understood to be just as important as these senses for their contribution to flavor especially with the sustained growth in interest in spicy foods from around the world chemesthesis chemical touch in food and eating surveys the modern body of work on chemesthesis with a variety of contributors who are well known for their

expertise on the topic after a forward by John Prescott and an introduction by Barry Green who originally coined the term chemesthesis 25 years ago. The book moves on to survey chemesthetic spices and address the psychology and physiology of chemesthesis, practical sensory and instrumental analysis, the interaction of chemesthesis with other chemical senses, health ramifications, and the application of chemesthesis in food. The major types of chemesthesis including pungency, burning, cooling, tingling, nasal irritation, and numbing are each covered in their own chapter. The book concludes with a look to the future. This is the first comprehensive book on chemesthesis since 1990 when Barry Green and his colleagues edited a volume on the perception of chemical irritants including those in food. This new book is intended to be a vital resource for anyone interested in the sensory impact of the food we eat, including food scientists, sensory professionals, analytical chemists, physiologists, culinary scientists, and others.

The bioelectronic nose, the device which has a similar function to the human smell sensing system, can be realized by combining the olfactory cells or receptors with nanotechnology. In the last two decades, much has been learned about the smell sensing mechanism in biological systems with knowledge about the biological olfactory system and the techniques for the expression of biological receptor proteins. We are able to utilize biological materials and systems to mimic the biological olfactory system. In addition to the advances in biological and biotechnological areas, nanotechnology has progressed to a great degree. The bioelectronic nose is a good example of the integration of biotechnology and nanotechnology. This book describes basic biological sciences of the olfactory system, biotechnology for the production of olfactory biological elements, and nanotechnology for the development of various sensing devices. The purpose of this book is to provide the reader with a concept, basic sciences, fundamental technologies, applications, and perspectives of the bioelectronic nose.
